

Samsung OfficeServ Conference Bridge

The complete conferencing solution

The OfficeServ Conference Bridge provides a fully featured voice conferencing solution enhancing the in-built ad-hoc 5 party conference capability on the OS7000 range of systems. OS Conference Bridge is compatible with the OS7200S, OS7200 and OS7400 systems. Each module will support up to 24 conference channels, either in one conference or multiple smaller conferences. Conferences can be recorded with the on-board recording facility that has a recording capacity of 50 hours and also can record up to 6 conferences simultaneously.

3 Types of conference supported;

Ad-Hoc

The Ad-Hoc conference is as its name suggests not premeditated. The person setting up the conference; the conference supervisor, dials the individual participants to the conference and then connects all members together.

Meet-Me*

A Meet-Me conference is reserved in advance; participants then dial in on a pre-set number and are greeted by the system. A welcome greeting is played followed by a prompt to enter a conference PIN code from their phone. When the correct code is dialled the participant is connected to the conference.

The Meet-Me conference is initiated by the conference leader, by using the web interface, this reserves a conference room for the right number of people and sends each participant an e-mail with the conference number, start time, duration and access number. The processes are automated and simplified from within the Conference Bridge.

All participants will dial in on the specified number at the set time, enter their details and wait, when the conference organiser joins, the conference will start and the speech paths between all participants will be opened up.

* Meet me conference is not supported on analogue trunks

Pre-Defined

This is a more rigid and pre-programmed conference to the Meet-Me. A number of conference groups are pre-configured in the system. Up to 100 groups can be programmed, each with a maximum of 23 members. This allows for a simple and quick set up of a regular conference. When the conference is initiated by the supervisor all members are called simultaneously by the system and added to the conference.

Benefits

Conferencing is becoming an important business tool, the ability to quickly and efficiently set up audio conferences to keep team members up to date with information can often make a big difference. At best out-of-date information is useless, often it is damaging.

The Conference Module enables your OS7200 and OS7400 system to provide this conferencing functionality and give you total control of who is using it and when, also by not using an expensive hosted dial-in service, costs are in your direct control. Big system functionality small system cost is our philosophy, why should large corporations have access to all these beneficial tools for doing business.

Samsung has successfully developed many applications that have all the required functionality but are scalable so that small groups of users can cost effectively deploy highly functional applications normally associated with big corporations and high costs.

Samsung OfficeServ Conference Bridge

Web Management

Status - The conference supervisor can see the status of each conference member

Lock/Unlock - the conference supervisor can Lock or Unlock the conference allowing or preventing any other members from joining.

Mute/Un-mute - The conference supervisor can mute or Un-mute members as well as members being able to do the same for themselves.

Reject - The conference supervisor can reject members of a conference

Conference reservation - The member setting up the conference (Conference supervisor) can reserve the resources required for the expected duration of the conference

Time Extension - The conference supervisor can extend the booked duration time of a conference, if there are enough available resources not previously reserved for another conference.

Conference List View and Inquiry - Conference supervisor can view the list of conferences as well as access any recordings made and make a local copy.

Announcement Registration - The conference supervisor can manage the lists of invitees to the conference, adding, deleting or modifying details such as e-mail addresses etc. as well as producing invitations and announcements regarding the conference.

Record - On setting up the conference or during the conference the supervisor can record all conversations. These can be downloaded to a PC after the conference and used as audio meeting minutes or an accurate account of what was discussed during the conference.

Capacity

Function	OS7200S	OS7200 (MP20)^	OS7400
CNF24 Module	1	2	4
Max conf channels	24	48 (Max 24 per conf)	96 (Max 24 per conf)
Recording Time	50 Hrs	50 Hrs per CNF24	50 Hrs per CNF24
Pre-defined conf groups	100	100	100
Members of pre-def group	23	23	23

^ OS 7200 MCP card is not supported

Features & Functionality

- Conference recording
- SIP trunk support
- Analogue trunk support (Meet-Me not supported)
- ISDN trunk support
- Analogue Ext support
- Digital extension support
- IP Extension support
- SIP extension support
- Meet-Me conference
- Pre-Defined conference
- Ad-Hoc conference
- Web management interface
- Registration of members
- Supervisor function
- Integration to handset display
- User extension of Conf period
- Expandable by licence Key
- Password protection
- Welcome Message
- Participant name announce
- First participant comfort tone
- Conference join alarm
- Conference leave alarm
- Conference end alarm
- Conference early start
